

ATHLETIC FIELD STRIPERS

Model 120

Standard Pressure (left) has a 7 or 12 gallon paint tank with 10" pneumatic tires, perfect for lining fields. This model was designed for high schools and soccer associations with a budget in mind.

Our most popular model by far. Dual spray tip included, sprays a forward and back to cover the grass for game day! Curves and radiuses are easily run by applying slight pressure on the handle. This light-weight design also allows sharper curves by simply raising the rear wheels slightly and striping around corners. Works great!

Model 310

Stripers are designed with higher pressure tanks and lines. This allows for thicker paint and faster output. Pressures of up to 115 psi can be reached with these units, making it possible to spray thicker paint and high production. It also works well with the 36" spray bar (see attachments for bordering your field. Dual spray tip included for spraying front and back to cover both sides of the grass (for game day)! If you are considering using the striper for your parking lots or streets the higher pressures are needed. Curves and radiuses are easily run by applying slight pressure on the handle. This light-weight design also allows sharper curves by simply raising the rear wheels slightly and striping around corners. Works great!
